<p>D1 discloses a method and an arrangement for producing dimensionally accurate metal foam, in which moulded parts are heated and foamed in a chamber. The wall is made, in particular, from a quartz glass base and thus has a coefficient of expansion in the order of graphite and yttrium oxide. The chamber is also constructed such that the inner geometry of the chamber can easily be adapted to the final geometry of the item to be foamed (see column 2, lines 14 to 18). The chamber in which the metal is foamed therefore cannot be distinguished from a mould. The semi-finished metal product is thus foamed in a dimensionally accurate manner. The semi-finished product is heated in the chamber using radiation energy from outside, which is made possible by a wall that is made of quartz glass material and is</p>
